Msc. CA 13-15 – Semester II

Web Content Management System – Project

Jaishankar Hebballi – 13030142017   Aaron Prince – 13030142025

Synopsis for
Tutorial Management System

The Tutorial management system provides a complete solution to any person who wants to create a learning system. This system will provide the means to create a website that has a possibility to host numerous tutorials and learning content. Our system provides users with the functionality of creating their own tutorial pages. The tutorial content can include text, pictures, videos and various styling options.

The user will be required to get the tutorial approved by some renowned person/persons in that particular field, who's name will be displayed on the page along with a short description of his/her bio-data. The users can view the Linkdeln profiles of these reviewers, so that they can judge their competency.

The system will provide a user sign-up, with basic registration details. After registration, users will be able to view the tutorials by entering their username and password.

Tutorials will have discussion forums where any registered user can comment, post a question, or point out defects in the tutorials. Users can also reply to specific posts. This system will be a web-based content management system written primarily in PHP.
